Exploration & Production: EOR & oilfield services

Every field still has barrels to give. Enhanced oil recovery on mature fields, the revival of marginal blocks and an integrated oilfield-services (OFS) task force: we go and get them.

+8–17%
Additional OOIP targeted (EOR)

8 services
Integrated OFS, under a single contract

4 materials
Chadian, for a sovereign EOR chemistry

1 contact
Six phases, one point of contact

The EOR approach: data first

- **Screening:** the right EOR is chosen in the data, not in the catalogue. Every method has its application window — crude gravity, viscosity, depth, temperature, permeability; the reservoir study, then the pilot, are what decide.
- **Sovereign chemistry:** natron, gum arabic, cotton cellulose and neem — four Chadian materials qualified for the reservoir: less hard currency leaving the country, a Chadian agricultural supply chain that gets paid, and know-how that stays.
- **Pilot-based method:** screening, laboratory, a pilot on 3 to 5 wells of a partner mature field, payment tied to the verified additional barrel above an agreed decline baseline, then extension. First pilot targeted within 2 to 4 years; within that period, phase 1 (years 1-2 after access to a field) includes the pilot.
- **Target fields:** the declining mature fields and marginal blocks of the Doba and Bongor basins, subject to agreement with the petroleum rights holder and the State.

Eight integrated OFS services

Well interventions
Twelve lines, from wireline to P&A: diagnose, intervene, secure, bring back online — the whole well cycle.

Production operations
Well integrity, production chemistry, treatment and reinjection of produced water, shutdowns & maintenance — the field’s operations, held daily.

Sites & logistics
Civil works for sites and all-weather wellpads, landlocked logistics and specialised fleet — “the right tank, at the right well, at the right time”.

Studies & data
Re-interpretation of public data, targeted seismic, reservoir modelling and digital twin: diagnose before committing a single piece of heavy equipment.

Contracting with EnerTchad

Three contract models, one non-negotiable HSE-Q foundation.

- **Per-job or framework services:** one intervention, one work order, one price for one-off needs and well emergencies; or rates and SLAs agreed for the year, with mobilisation on demand — wireline, workover, maintenance, logistics.
- **Study & pilot paid per additional barrel:** data access under NDA, process screening in your reservoir data, then a pilot on 3 to 5 wells. Payment tied to the verified additional barrel: above an agreed decline baseline, under joint measurement.
- **Consortium or equity stake:** local set-up with operators, oilfield-services companies and the academy for tenders and multi-well campaigns; a minority interest when the study demonstrates the potential. Any assignment of interests requires the prior authorisation of the Minister in charge of Hydrocarbons (art. 21, Law No. 006/PR/2007).

The HSE-Q foundation

- **HSE-Q:** systematic work permits, LOTO lockout, stop-work authority for every worker, pre-task risk analyses; well barriers and kick control, IWCF/IADC certification targeted for all personnel on pressurised operations. Zero accidents: the HSE objective, from day one.
- **Local content:** 80% local content targeted — priority to Chadian companies and talent, inputs sourced in-country whenever possible, skills transfer through Tchaditude.
- **Standards & reporting:** ISO 9001 · 14001 · 45001 approach targeted, HSE reporting shared with the client; TRIR, LTIF and Tier 1 and Tier 2 process safety events published from the first worksite, using IOGP definitions.

Start the conversation. E&P operator, block holder or technical partner: write to contact@enertchad.com (subject “E&P operator”) — study, EOR pilot or OFS intervention. Online resources: /pole-amont-en, /amont/eor-en, /amont/services-ep-en, /amont/titulaire-droits-petroliers-en, the integrated service configurator and the additional-barrel calculator (in French).

Sourced reference points

- **Chad’s proven reserves:** 1.5 bn bbl (2018, trade.gov).
- **National production:** 55.48 million barrels of crude in 2023, of which 48.15 million exported (Chad EITI Report 2023).
- **Doba crude:** 20.5° API (2004 assay, Oil & Gas Journal); water cut of about 86% in 2011 (Esso).
- **Methane & flaring:** EnerTchad aims to endorse the World Bank’s Zero Routine Flaring by 2030 initiative and to report its methane emissions under the OGMP 2.0 framework from its first operations.

Company status. EnerTchad S.A. is in formation. Petroleum titles held: none to date; no asset in operation to date. The capabilities described are targets.

The extended E&P offer

Four specialised lines that complete the oilfield-services catalogue — from the laboratory to the control room — and five pre-assembled packs, one per field phase. Details: enertchad.com/amont/services-ep-en

Geosciences & laboratory

Coring & petrophysics, PVT and fluid analyses in Chad (target), reservoir modelling with P10/P50/P90 uncertainties, a phased Field Development Plan (FDP) and a 1P/2P/3P reserves file ready for certification — a marginal-field FDP in 6 to 10 weeks (target).

Advanced interventions

Sand control & gravel pack for unconsolidated sandstones, extended well testing (multi-rate tests, PLT), NDT inspections (ultrasonics, magnetic-particle, radiography), downhole diagnostics by memory slickline.

The digital field

24/7 monitoring from a control centre in N'Djamena (target), SCADA & hybrid gas-solar telemetry, digital twin and production allocation, operator reporting & data room.

Packs by field phase

Five pre-assembled scopes, at target stage: EnerScope (explore & de-risk) · EnerBuild (develop) · EnerRun (produce & optimise) · EnerRevive (mature field) · EnerClose (P&A). Each pack opens the configurator pre-set.

How these capabilities fit together

- **A single entry point:** start from your field phase (five packs), a family of services (eight integrated services) or a specific intervention (the catalogue line by line).
- **Immediate pricing:** the service configurator — profile, volumes, domains: an indicative envelope recalculated live, a shareable brief.
- **A dated roadmap:** milestones counted from access to a field — phase 1 (years 1-2) validation & pilots, phase 2 (years 2-4) ramp-up, phase 3 (years 4-7) integration & scale.

Nine domains, from prospect to barrel

The hub’s competency map, with artificial lift as the flagship expertise. Expertise targeted by a company in formation: built with Tchaditude, contracted through the oilfield services. Interactive detail: enertchad.com/pole-amont-en#expertises

★ Artificial Lift — flagship expertise

ESP (electrical submersible pumps) · Gas lift · PCP (progressing cavity pumps) · Rod pump · Lift system selection · Equipment surveillance · Rate optimisation · Performance analysis

Exploration

Geology · Geophysics · 2D / 3D seismic acquisition · Seismic interpretation · Prospect evaluation · Resource estimation · Basin studies · Reserves management

Drilling & completion

Well design · Exploration drilling · Development drilling · Directional drilling · Geosteering · Cementing · Well completion · Workover

Field development

Development studies · Field planning · Facilities construction · First oil & start-up · Petroleum project management · Infrastructure development

Production

Field operations · Well operations · Production management · Performance monitoring · Reservoir management · Production optimisation · Production allocation

Production engineering

Production engineering · Well performance · Well testing · Nodal analysis · Production surveillance · Flow assurance · Debottlenecking · Asset optimisation

Maintenance & integrity

Preventive maintenance · Corrective maintenance · Asset integrity · Equipment inspection · Facilities reliability · Shutdown management · Corrosion & inspection

Exploration & Production HSE

Occupational health · Operational safety · Risk management · Environmental protection · Waste management · Emergency plans · Regulatory compliance

Digitalisation & innovation

Oilfield digitalisation · Monitoring centre · Oilfield IoT · Data analytics · Artificial intelligence · Predictive maintenance · Digital twins

The nine domains and their 66 competencies are detailed on the /pole-amont-en hub, with links to the method pages.
